Summary

Backend-focused Software Engineer with hands-on experience building scalable REST APIs and distributed microservices in production FinTech, AI and Enterprise environments. Passionate about system design, reliability, and backend architecture.

Education

BNM Institute of Technology, Bengaluru

Bachelor of Engineering in Computer Science and Engineering

November 2021 – June 2025

GPA: 9.01/10

Experience

Associate AI Developer

June 2026 – Present

Etihad Engineering (via Connection Group)

Bengaluru, Karnataka, India

Tech Stack: Python, FastAPI, LangGraph, RAG, React, Docker, PostgreSQL, OpenSearch, OCR, OAuth 2.0, OCI (IDCS, Autonomous Transaction Processing, Object Storage, Compute), Oracle WebCenter Content (WCC), Oracle Capture

- Designed and built the backend for a **document version control system** for aviation maintenance manuals. Authors revise the manuals on a cycle, and the finalised versions become the source of truth for a separate group of users. Drafts go through hierarchy-based approvals using workflows and state management, with RBAC and OAuth sign-in through OCI IDCS. Metadata sits in Oracle ATP, files in Oracle WCC on Object Storage, and the app runs on an OCI VM.
- Built a **LangGraph RAG chatbot** for the manuals using chunking, embeddings, MMR(Maximum marginal relevance) retrieval and prompt caching. PostgreSQL stores the vectors, and new embeddings are added as soon as a manual is revised.
- Migrated **1.5 TB+ of data to Oracle WCC** with department-wise security-group access, retention policies and alerts. Also built a chatbot for access requests and new users, and an OCR capture flow with **OpenSearch** so people can search the text inside PDFs.
- Built the licensing feature for **AI Watchtower**, an on-premise monitoring tool for VMs/EC2 with AI reports, anomaly detection and alerts, and deployed it in the private tenancies of **3+ customers**.
- Built an HR claims chatbot for Etihad that reads receipts with OCR and checks the details against the employee's company transactions, which makes claim approvals easier.

Software Development Engineer – Backend (Intern)

June 2025 – March 2026

Bright Money – AI-Driven Consumer FinTech

Bengaluru, Karnataka, India

Tech Stack: Python, Django, PostgreSQL, Kafka, Celery, Redis, AWS Glue, Mixpanel, Split.io (A/B experiments), New Relic, Grafana, Jenkins, GitHub Actions, Docker

- Migrated LLM-powered product features (Rent Reporting, Subscription Management) from asynchronous runtime inference to a Feature Store-based architecture, improving reliability and reducing service coupling.
- Rebuilt the Rent Reporting product (credit score improvement) end-to-end, implementing notification services, user journey, cron jobs for GFR/FGFR updates, and an AWS Glue job to filter eligible users; supports ~40k+ monthly users.
- Designed and implemented high-scale event-driven notification workflows (5M+ and 10M+ users), increasing user re-engagement by 20%.
- Coordinated Privacy Policy updates rollout for 1.4 million customers, collaborating with frontend teams to ensure smooth migration without impacting user experience

Projects

Agentic Hiring Workflow (Multi-Agent Candidate Research and Ranking)

Tech Stack: Python, LangGraph, LangChain, FastAPI, RAG

- Built a hiring workflow in **LangGraph** where a supervisor node splits the work across specialised nodes.
- The nodes research a candidate's LinkedIn, GitHub and past companies, predict salary, and rank their experience and projects.
- Given a drive of 100+ resumes, the supervisor researches all of them and keeps the context of every profile.
- HR can chat with the supervisor to decide whom to take forward, with the reasoning and research behind each suggestion.
